Session title	My First Webpage Using HTML	Date	_____	Location	ICT Lab 208
Learner group	Grade 4	Duration	40 minutes	Group size	_____

Learning aims A statement which provides the scope of the subject and the overall intent of the course.	Learning Aim (According to Bloom's Taxonomy): To understand what a webpage is, identify the tools used to create it, and write and view a simple HTML page with one main heading. Reference: Teacher-prepared Grade 4 HTML notes and the agreed first-webpage code. Teacher: Zubair Maqsood.

Learning objectives What are learners expected to learn after completing the lesson? These should be specific and able to be assessed.	Student Learning Outcomes (SLOs) - According to Bloom's Taxonomy By the end of the lesson, students will be able to: 1. Define a webpage and identify a text editor, a browser and HTML. (Remember) 2. Explain the purpose of the document declaration and the html, head, title, body and h1 tags. (Understand) 3. Create, save and open a simple HTML webpage showing their first name as a main heading. (Apply)

Inclusion **How will you make your lesson inclusive?**	I will use simple English, enlarged code and a live demonstration. Learners may explain ideas aloud before writing; Russian or Kyrgyz vocabulary support will be available. Pairs will share typist and checker roles, then swap. Differentiation: Support: provide a complete printed code model and saving checklist. Core: create and open the page. Advanced: change the tab title and explain how it differs from the main heading.

Time	What are you doing?	What are your students doing?	Learning materials and resources
2 min	I will take attendance, prepare the Smart Board and display the topic and three SLOs. I will check that Notepad and a browser are available.	Students will settle, prepare notebooks and read the SLOs. They will identify the programs available on their computers.	Smart Board; computers; Notepad; web browser; Grade 4 HTML notes.
3 min	Previous Learning / Engage: I will ask: Which program do we use to browse webpages? I will display a simple page and ask what students can see.	Students will recall a browser they have used and name text or pictures on a webpage. They will share ideas about how a page is made.	Smart Board; a simple local webpage; notebooks.
5 min	Explore: I will show Notepad beside a browser displaying the finished page. I will ask pairs to compare the code with the browser tab and the visible heading.	Students will compare the two windows. They will locate My First Webpage on the tab and Hello! My name is Ali. on the page.	Notepad; browser; prepared index.html example; computers.
10 min	Explain: I will define a webpage as a page viewed in a browser. I will introduce HTML (HyperText Markup Language), a markup language. I will explain the declaration, html, head, title, body and h1 using the code model. I will model opening and closing tags and explain that this local page needs no internet.	Students will record a short definition and identify the editor, browser and HTML. They will explain that title names the browser tab, body holds visible content and h1 creates the main heading. They will match opening and closing tags.	Smart Board; enlarged complete code model; Grade 4 HTML notes; notebooks.

Time	What are you doing?	What are your students doing?	Learning materials and resources

6 min	Elaborate - Practical Task 1: I will display the complete model below. I will guide learners to type it in Notepad and replace Ali with their first name. I will point out brackets, slashes and closing tags.
	
	`<!DOCTYPE html>`
	`<html>`
	`<head>`
	`  <title>My First Webpage</title>`
	`</head>`
	`<body>`
	`  <h1>Hello! My name is Ali.</h1>`
	`</body>`
	`</html>`
		Students will type the displayed code carefully. They will use their first name only. Partners will check that every opening tag has its matching closing tag and that the heading is inside body. They will swap roles.	Computers; Notepad; Smart Board; complete HTML code model; printed support copy if needed.

9 min	Practical / Lab Activity - Task 2: I will demonstrate File > Save As, filename index.html, Save as type: All Files, then Save. I will ask learners to open the file in a browser. I will support corrections if a page does not show as expected.	Students will save as index.html in their class folder and open it in a browser. Expected output: My First Webpage on the tab and Hello! My name is [their first name]. as a large heading. They will correct missing tags or an accidental .txt extension, save and refresh.	Computers; Notepad; browser; class folder; saving checklist. No internet connection is required.
4 min	Evaluate / Formative Assessment: I will give an individual exit ticket: (1) What is a webpage? Name the editor, browser and language used. (2) Match the declaration and five tags to their jobs. (3) Show your saved page and point to the tab title and heading. I will check responses and files against all three SLOs.	Students will answer independently: a webpage is viewed in a browser; Notepad is the editor; HTML is the language. They will match the code parts to their jobs and show their working page. They will identify any step where they need help.	Exit questions on Smart Board; notebooks; saved index.html files; code-and-purpose matching prompts.
1 min	I will summarise webpage, HTML, editor and browser. Homework: write what a webpage is, name the tools used, and copy the complete model into your notebook. Circle title and h1 and write what each does. No computer is required.	Students will share one learning point and record the homework. They will state that the tab title and main heading appear in different places.	Grade 4 HTML notes; notebooks; complete code model.

Lesson Evaluation:

What went well: _____ Evidence of SLO achievement: _____

What I would improve next time: _____ Learners requiring follow-up support: _____
